The Sedimentary Record Of Sea

This lavishly illustrated textbook describes how past changes in sea-level can be detected through an analysis of the sedimentary record, and how sequence stratigraphy techniques can provide explanations of how the entire sedimentary system evolves through geological time.

The sedimentary record preserved in the core material extracted from the Gulf of Carpentaria presents an environmental history spanning the last glacial cycle; however, hiatuses are indicated by pedogenic intervals. The sequence of marine and non-marine deposition recorded in the cores provides sea-level data for the region to allow comparison

THE SEDIMENTARY RECORD

The estuarine surface sediment and sedimentary core were sampled in April 2013, which has been described in detail previously (X. Peng et al., 2017). The sedimentary core (22°16', 113°38') was collected using a gravity corer with a depth of 54 cm and was sliced at the site with intervals of 2 cm.

Sedimentary rocks are types of rock that are formed by the accumulation or deposition of small particles and subsequent cementation of mineral or organic particles on the floor of oceans or other bodies of water at the Earth's surface. Sedimentation is the collective name for processes that cause these particles to settle in place. The particles that form a sedimentary rock are called sediment ...
